Siemens Digital Industry Software

Consumer Packaged Goods is Evolving

Challenges & Opportunities

3. Product diversity & customization

-  Input material in batches
-  Different provision sources
-  Environmental conditions
-  Variable storage timing

1. Uncontrollable variations in input material properties

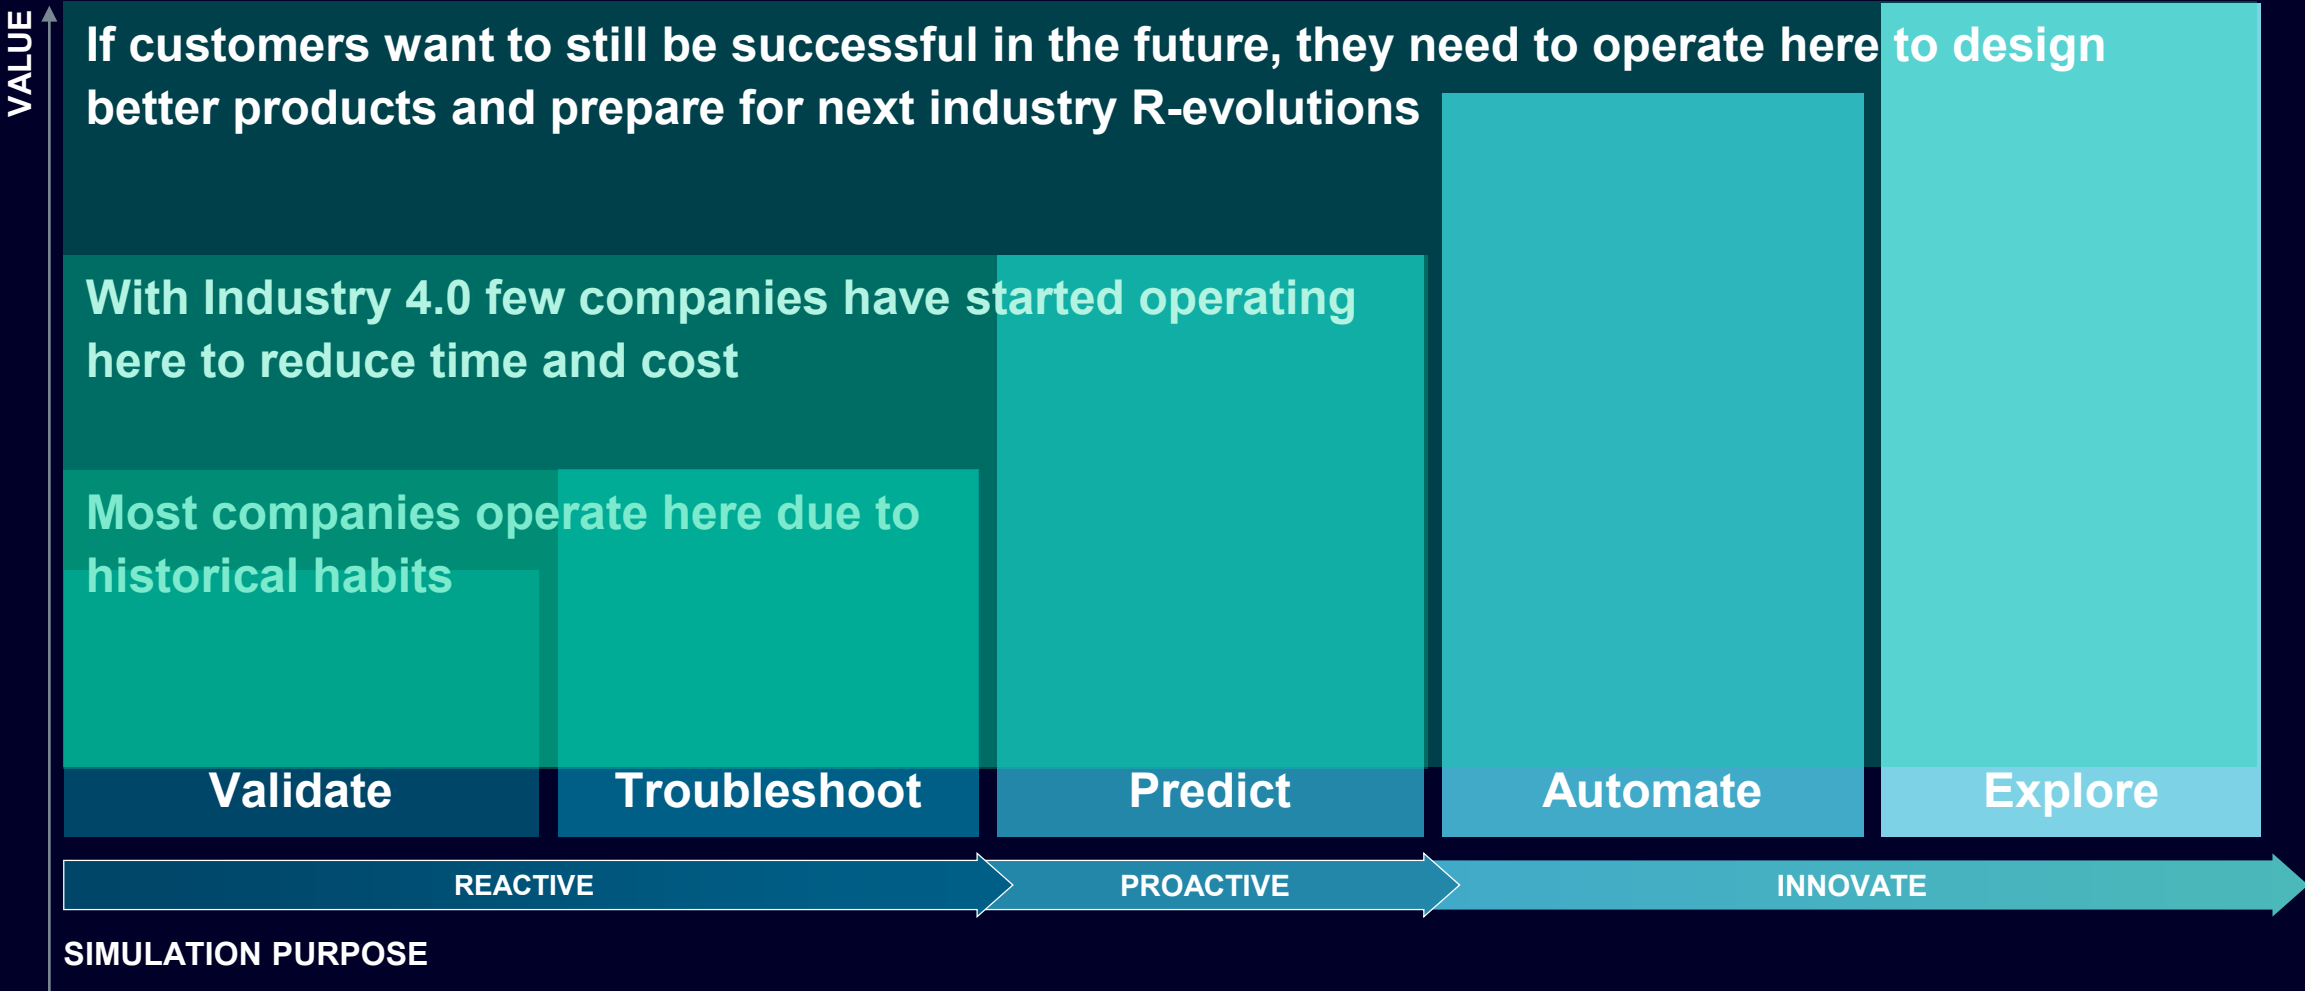

2. Slow feedback loop due to many human interactions

Off-target product

Siemens Solution

From Digital Twins ...

Precise virtual representation of a physical product or process

Used across its lifecycle to simulate, predict and optimize the product and production system

Made up of multiple representations or models for different aspects of physical behavior

An evolving object with a lifecycle that needs to be managed

Closed-loop digital twin provides for bi-directional connectivity between the physical asset and the virtual representation

feed back insights to continuously optimize product and production

Design

Production

In-Service

Siemens Solution

... to Executable Digital Twins (xDT)

For smarter products, systems, processes

Digital
xDT
Real

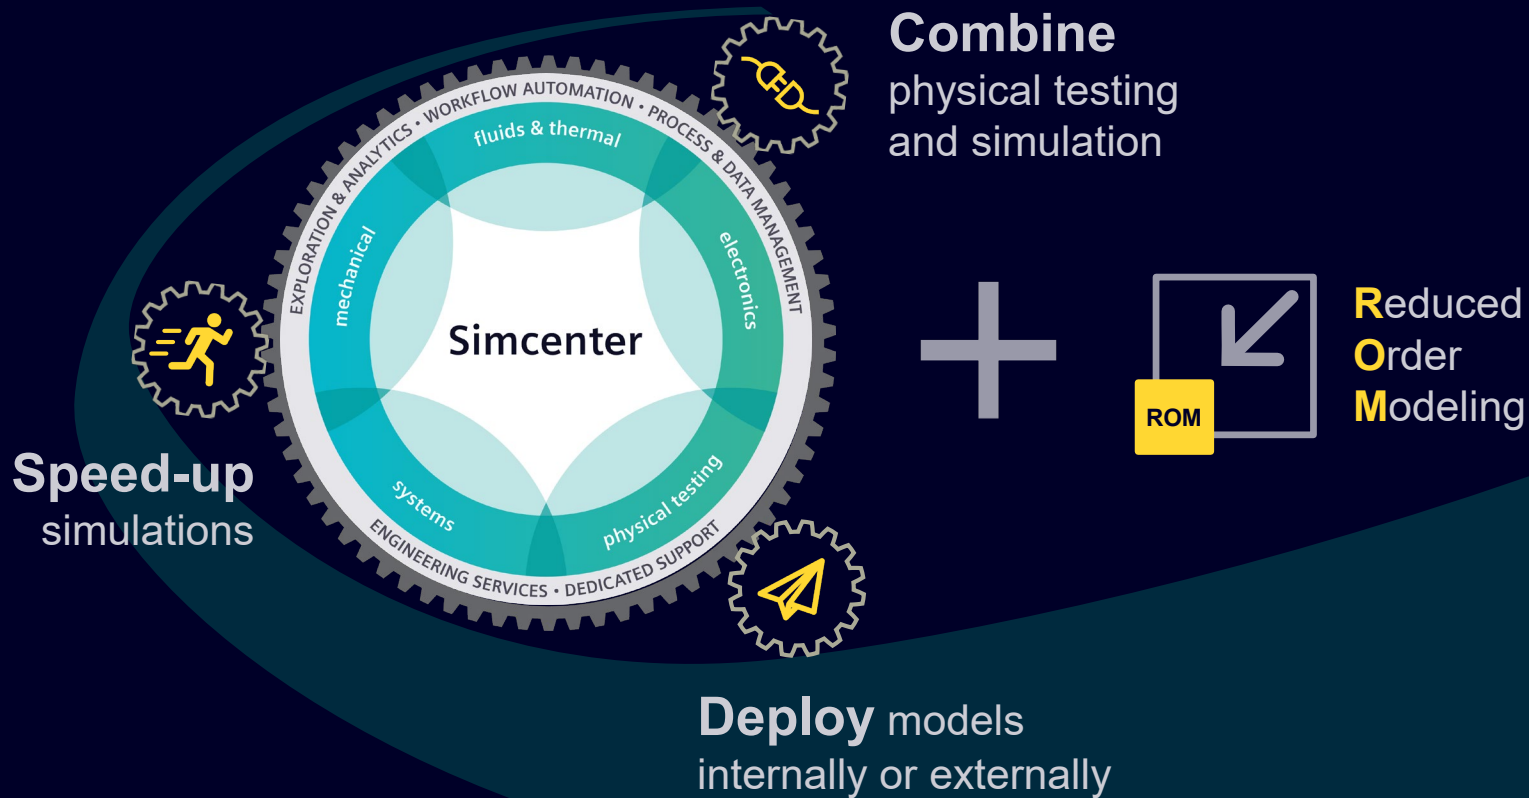

Self-contained executable digital behavior of an asset

Leveraged by anyone at any point in lifecycle

- Developed & released by experts
- Real time enabled
- Self-adapting/calibrating
- No additional solvers required
- Deployed from edge to cloud
- Leveraging virtual sensors

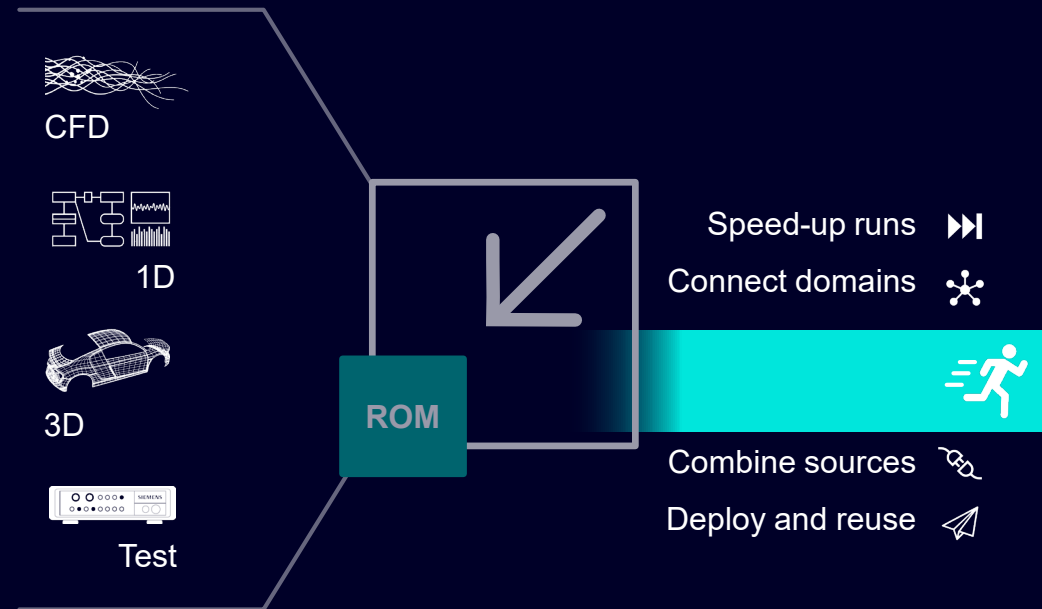

Key Enabler for Executable Digital Twin - Simcenter ROM Builder

- A digital twin catalyzer
- An enabler for xDT*
- A tool-agnostic solution

For simulation users, the Simcenter ROM Builder creates simplified, tool-neutral, re-usable models by processing simulation and field data.

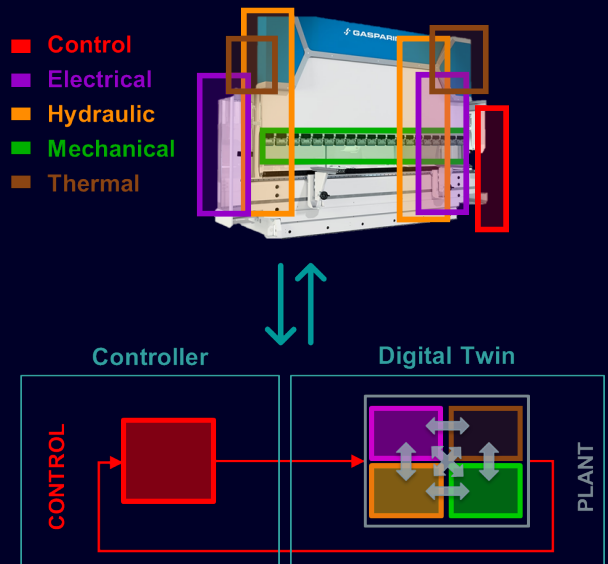

Siemens Solution

Technical Approaches with Digital Twins: Virtual Commissioning and Virtual Sensing (xDT)

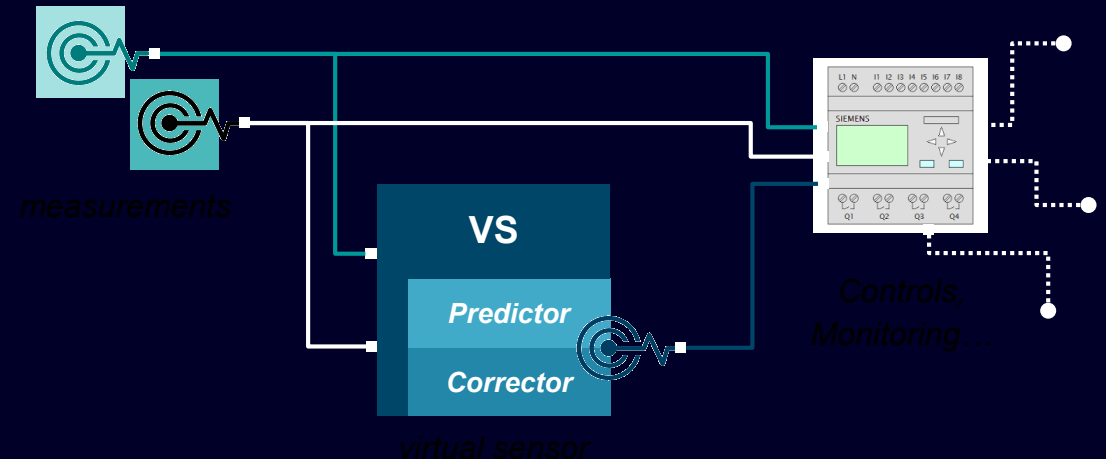

Virtual Commissioning and Virtual Sensing (xDT) – What?

VIRTUAL COMMISSIONING

Digital Twin of the system to support the automation code development, integration and tuning

VIRTUAL SENSING (xDT)

Executable Digital Twin: Combine a reduced set of measurements and a real time model to virtually sense variables

System Simulation with Simcenter Amesim

Systems modeling and simulation for every phase of development

Extensive library of multi-physics components

Systems sizing and integration

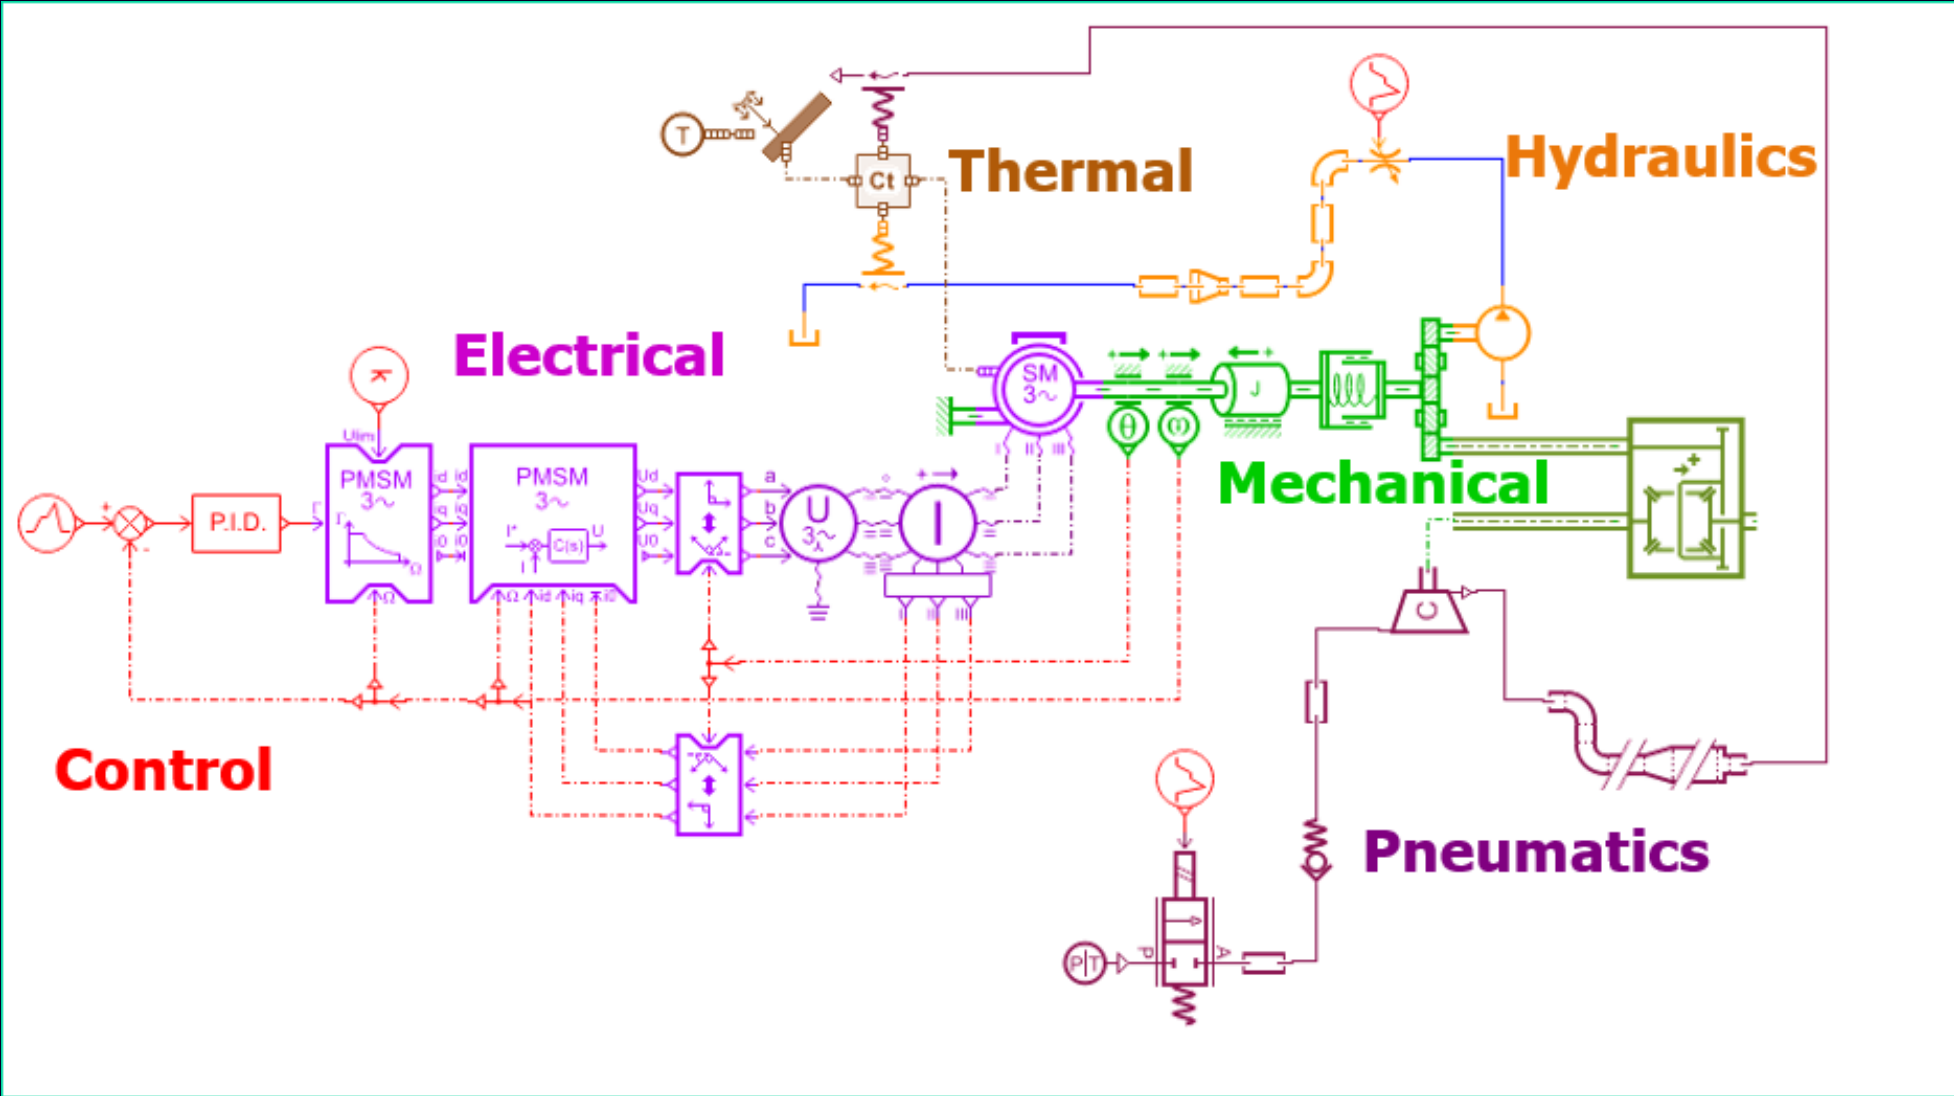

Performance balancing

Controls verification and validation in real-time (HiL)

Virtually assess and optimize the performance of mechatronic systems

System Simulation in a Nutshell

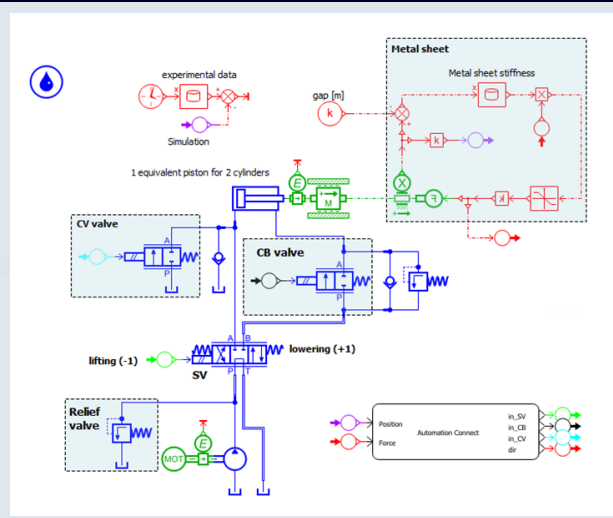

Virtual commissioning at the Unit Level

Physical and kinematic model
Mechanical components

Electrical model and behavior model
Component (e.g. drives) and periphery behavior

Automation model
Logic of the PLC program and visualization

System Level Simulation

Virtual controller

Capabilities

- Size components according to performance needs
- Verification of PLC and drive logic with out-of-the-Box behavior models for drive control
- Reuse of models for in operation simulation for additional information on the current state of the machine and additional safety loops (virtual sensors)

Virtual commissioning with Simcenter Amesim and PLCSIM Advanced

Leveraging Simcenter Amesim Automation Connect for control validation

Executable Digital Twins (xDT) to Improve Assets Automation Implementation process

Implementation of xDT – How?

1

Develop the digital twin model

Equation driven models
Geometry based models
Surrogate models
Hybrid models

2

Virtual sensor synthesis

Reduced Ordered Models x RT compatibility
Predict KPIs based on parameter settings and operational feedback

3

Control upgrade

Advance control algorithm to overcome traditional approaches' limitations

Executable Digital Twins (xDT) to Improve Assets Automation Implementation process

1. System understanding and digital twin model

Analysis of historic data

Develop surrogate models of systems with high level of non-linearities and cross coupling between the inputs towards the outputs.

Digital twin

The digital twin model integrates various simulation domains: Mechatronics & Controls, Chemical, CFD, Test, Electromagnetics, and Structural.

Executable Digital Twins (xDT) to Improve Assets Automation Implementation process

2. Virtual sensor synthesis

Leveraging Digital Twin to create compound sensors to properly close the control loop and estimate the full impact on the KPIs.

Contamination & ageing

Event recognition

Component life time

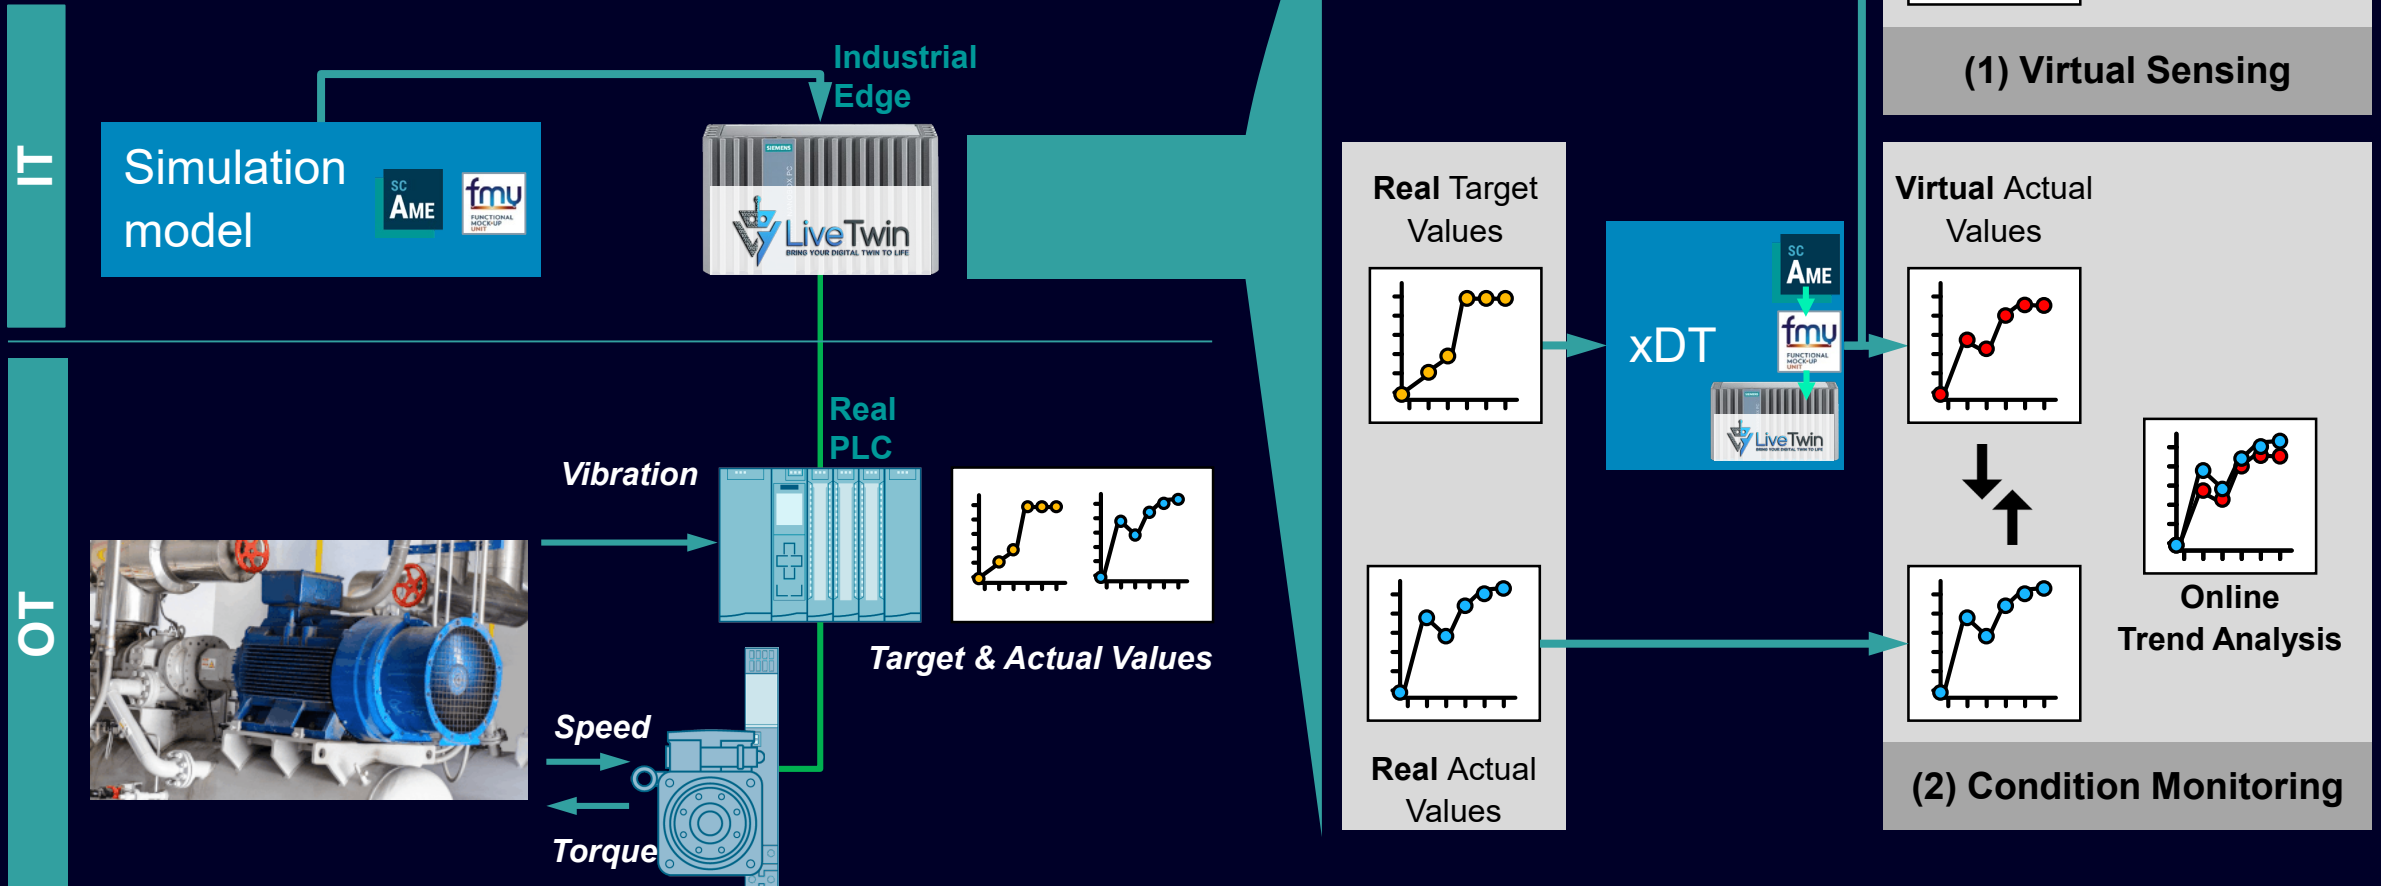

Sensory characteristics

Material properties

Executable Digital Twins (xDT) to Improve Assets Automation Implementation process

3. Deploy to Industrial Edge

Reduce downtime and increase quality with better thermal management control system using xDT

More efficient production process

Lower cost

Higher quality product

Chocolate temper unit optimization

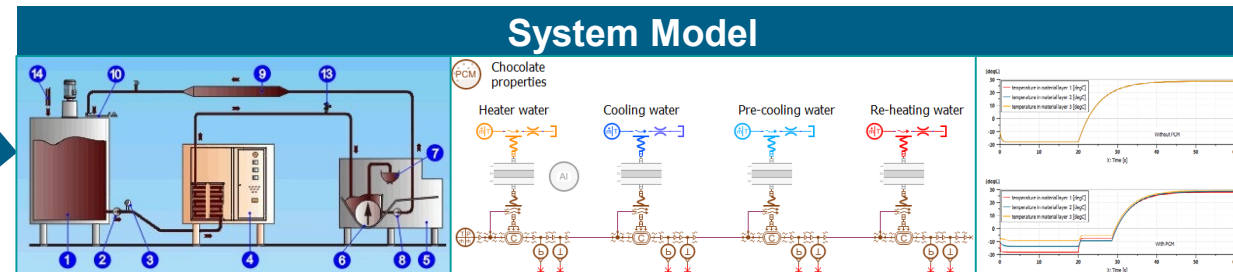

- Extension of the chocolate production time between 2 cleaning sessions of the unit

Challenge

Improve temper unit control algorithm to maintain stable chocolate organoleptic characteristics over time considering machine performance degradation

Solution

Temper unit system model to capture influence of machine properties degradation on chocolate crystallization structure deployed as virtual sensor on edge device

Improve production efficiency and quality with automated quality control using xDT

More efficient production process

Lower cost

Higher quality products

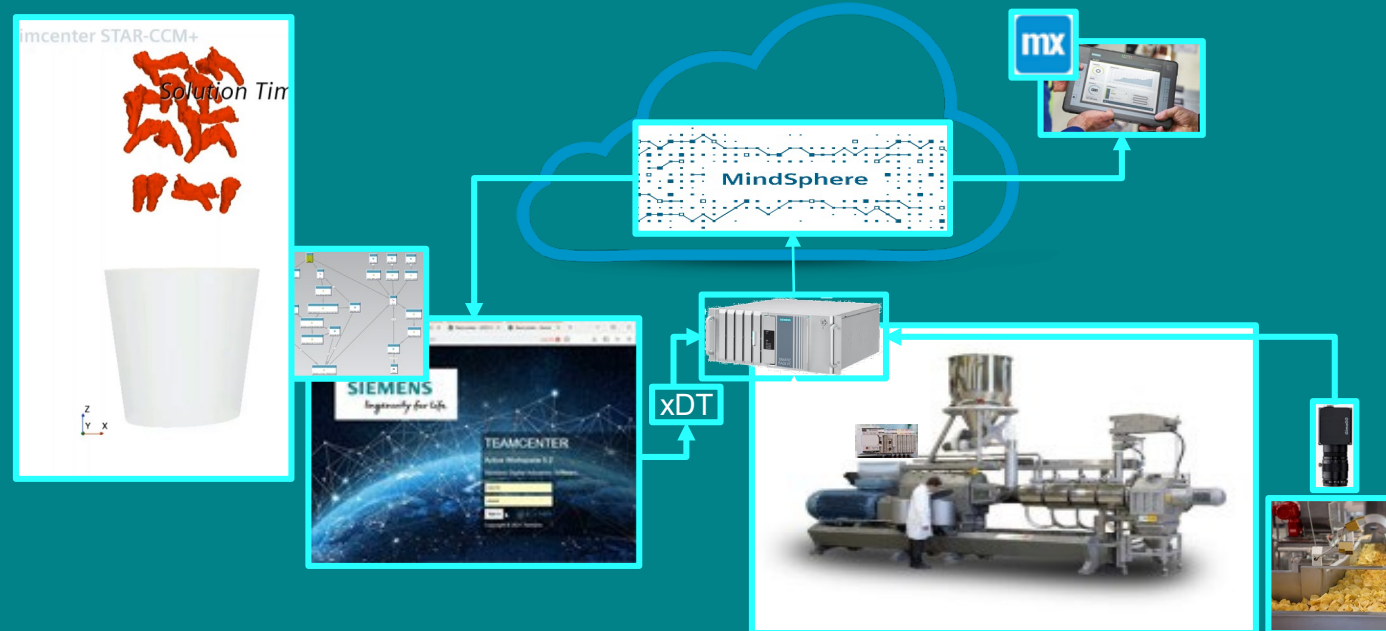

Automated Quality Control

Challenge

Extruder-based food products need to satisfy specific shape requirements for quality and packaging but the relationship with the extruder control is complex

Solution

xDT implementation integrating vision-based feature extraction, packaging related virtual sensor, and machine learning based extruder control

Improved operational control and performance while reducing costs

Enhanced information

xDT provides a path to a digital future

>10%

Reduction on operational costs

Improve operational efficiency of water reservoirs

Challenge

Over/underfilling the reservoirs causes shortages

Uncertainties in the piping layout and impossibility to measure in some locations

Current control strategy relies on operator experience

Solution

Real-time full-fidelity model providing virtual measurements of fluid flows, liquid levels and energy usage. This enables the smart control of the plant and increase sustainability.

Siemens simulation solutions

From Digital Twins (DT) to Executable Digital Twins (xDT)

Precise virtual representation of the physical product or its production line

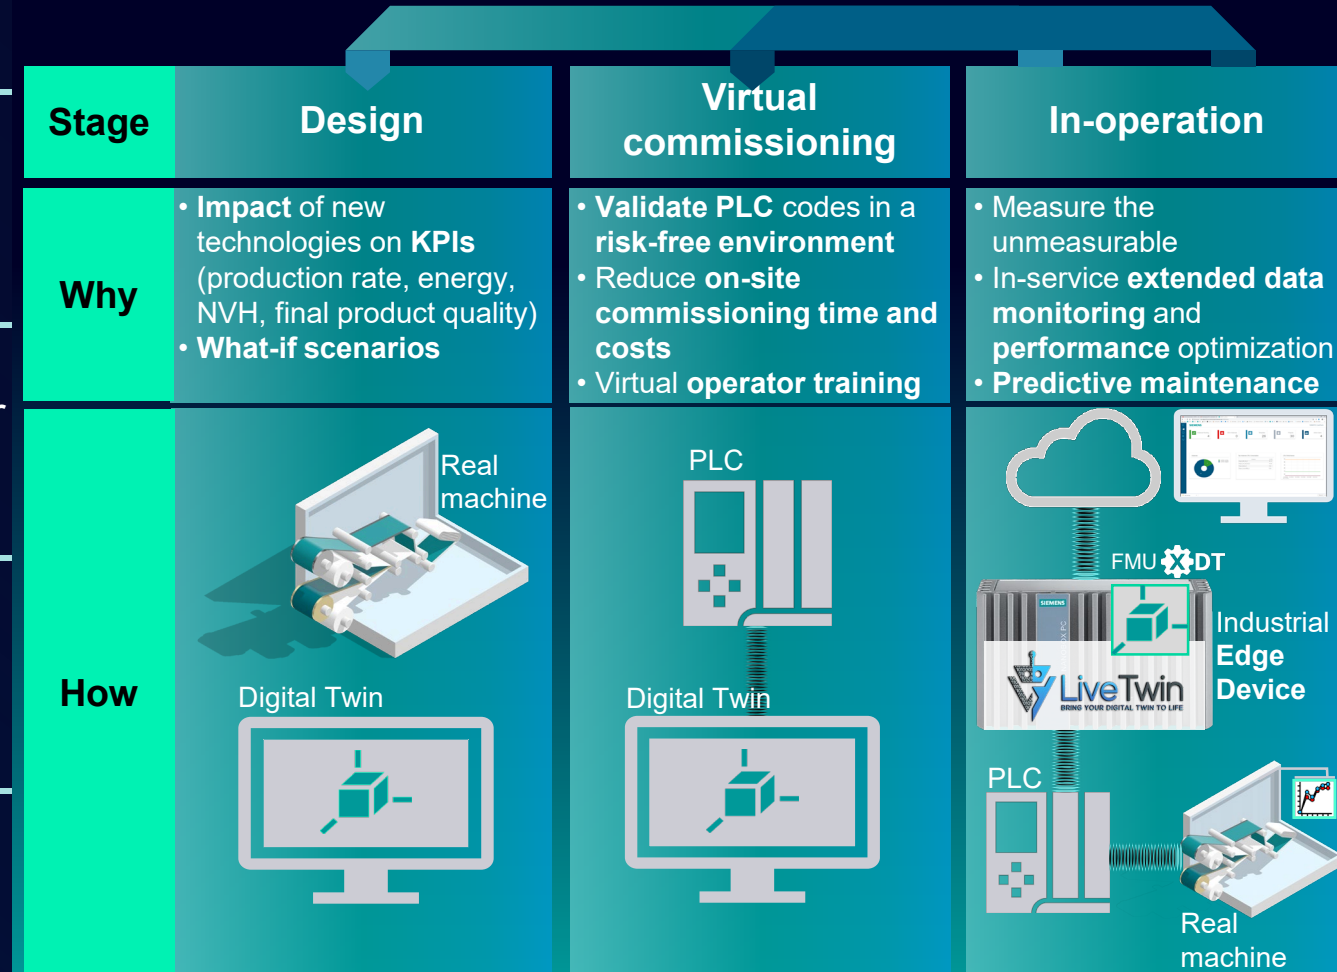

Used across its lifecycle to simulate, predict and optimize the product or its production line

Made up of multiple representations or models for different aspects of physical behavior

An evolving object with a lifecycle that needs to be managed

Closed-loop digital twin provides bi-directional connectivity between the physical asset and the virtual representation

Feedback insights to continuously optimize the product and its production
