Problem: Short maintenance cycles of petroleum-based lubes

Solution: Teflon®-based Tri-Flow® oil and grease

A food processing plant found that petroleum-based lubes emulsify during dead water washouts, do not have strong waterproof characteristics, and require maintenance after each dead water washout/work shift.

The plant switched to synthetic-based Tri-Flow food grade oil and grease, which withstood up to four washouts - one whole day of shift changes - before requiring machine maintenance. As a result, the food plant reduced its lube cycles by 75%.

The comprehensive Tri-Flow and Sprayon product families offer a broad range of solutions to challenges like this throughout the food processing industry. For our full line of food grade solutions, please call for a catalog at: 1-800-925-3434.
